4) GenAI Prompt

Build a register feature for a Node.js + Express app with a simple JSON file database.

Requirements:

- Create a POST /api/auth/register route.
- Create backend logic in register.js.
- Request fields: name, email (used as username), password.
- Password rule: at least 8 characters, include 1 uppercase letter, include 1 special from !@#\$%^&*.
- Frontend must validate the password rule before sending.
- Backend must reject duplicate emails by checking auth_user.json.
- On success, hash the password and store the new user in auth_user.json.
- Return 201 on success, 400 for validation/duplicate, 500 for server errors.
- Include clear code comments explaining the logic.
